Postgraduate course
aimed at adult and
paediatric
endocrinologists
both trained and in
training

Course overview and objectives:

Adrenal disease is very rare.

This course tackles a critical and often overlooked area of endocrinology, focusing on adrenal insufficiency. A condition that is rare but can be life-threatening if not diagnosed in a timely manner. The simplicity of treatment post-diagnosis contrasts sharply with the potential severity of untreated cases, underscoring the importance of adept recognition and management in medical practice. It is therefore very important indeed in endocrinology.

Join our dynamic learning environment, led by world leaders in the adrenal field, featuring interactive sessions and debates. This course will enhance your understanding and skills to anticipate and manage adrenal insufficiency, deepening your expertise for improved patient outcomes.

Participants are encouraged to send a case presentation.

- What are the causes of adrenal insufficiency and what are the recommended investigations?
- How do we treat adrenal crisis?
- How do we treat secondary adrenal insufficiency and how is this different from primary adrenal insufficiency?
- What are the early signs and symptoms we should not miss?

Deadline for
registering:
26th of
September
